Energy Transactions

Cullen and Dykman Energy and Utility attorneys assist clients on transactional matters relating to electric power, natural gas and telecommunications. This experience is extremely varied. It includes assistance on a broad variety of commercial matters and contracts related to many types of transactions, including power purchase agreements; LLC operating agreements, shareholder agreements and joint venture agreements; employment and consulting contracts; engineering, procurement and construction contracts (particularly for generation, transmission and interstate pipeline facilities); contracts for the supply, transmission and management of energy and other services and commodities; and computer software contracts. In this area, the firm's clients include public utilities, energy brokers and marketers, generators, interstate pipelines, oil and gas producers, financial institutions, colleges and universities and other institutional clients. This practice area often overlaps with our energy and utility regulatory practice areas where state and federal regulatory issues arise in connection with existing or contemplated transactions.
